

ZEALWISH

Create. Grow. **Own** your AI character.

Open-source character infrastructure: a portable, wallet-owned memory passport for the AI companion era.

01 / THE PROBLEM

You don't own your AI. Today's companions lock your character — and every memory — inside one company's database. Switch apps and you start from zero; the data trains their model, not your character.

02 / THE SOLUTION

01 CREATE

Your character

Visual identity, personality, voice, and origin — shaped through interaction.

02 GROW

Persistent memory

A local-first memory vault: capture, distill, recall. Continuity, not disposable chat.

03 OWN

Character passport

A wallet-linked, signed, exportable passport — anchors identity and travels across worlds.

03 / WHY NOW

Companion AI is exploding (30.8% CAGR), and portable agent-identity standards just arrived — NIST AI Agent Standards Initiative (2026), W3C DID/VC, MCP-I. **Nobody owns the consumer character layer yet.**

04 / WHAT'S REAL TODAY

- ✓ Working desktop + web app
- ✓ Memory engine + voice (ASR/TTS) live
- ✓ OKX wallet connect live
- ✓ 8 dev branches · 22 automated tests · open source

05 / WHY WE WIN

Trust

Local-first ownership turns Character.AI's biggest liability — data lock-in — into our default.

Network effects

A portable passport gains value with every new world that reads it. Incumbents can't open up without breaking their model.

Creator economy

Skins, personalities, and worlds on an open marketplace.

Model: open core + creator marketplace + passport services.

The ask: early users & creators · open-source contributors · pre-seed partners to build the ownership layer for the AI companion era.
